

ABSTRACT

A modeled cream bottle comprises a model having a receiving house and a receiving chamber beside the receiving house; a bottle body received in receiving chamber of the model; an press head an upper portion of which protrudes from the outlet of the receiving house, and a button being
5 fixed to the press head. A guide tube extends into a bottom of the receiving chamber through the guiding space and another end of the guide tube extends into an inner bottom of the bottle body. Another guide tube communicates to the outlet portion of the press head. By pressing the
10 press head, the cream in the bottle body is sucked out from the guide tubes and then flows out of the model.
